It's not easy to find a good VPN provider nowadays especially if you're just starting out. For the price, you can't beat Private Internet Access. The price is right, the performance is awesome, and the software client is great. The only downside is that when using Windows 10, you need to use Private Internet Access. Which isn't surprising considering that's where the VPN client is located. However, if you're not running Windows 10, you're in luck because Private Internet Access is available for other operating systems as well. Not bad, right? The free version of this VPN costs money, but only \$4.75/month. That might seem like a lot, but if you can use this program on multiple computers, you can save money. Another program called HideMyAss that also offers similar functionality. It isn't as comprehensive as Private Internet Access, but it might be your best option if your operating system isn't supported. However, they have a free version available for you to try. Should you choose to continue, it'll cost you \$4.25/month. The security of VPN is pretty decent as long as you follow a few rules, so it's not hard to use. Private Internet Access has everything you could possibly need, and it has a nice, clean user interface. The app is designed for Windows, but you can use the app on other operating systems using a virtual machine. However, it's free to use, so you won't have to pay anything to try it out. The free version only offers a free trial. However, it's more than sufficient for testing. In addition to being the cheapest option, it also has the best user interface. HideMyAss's interface is also quite nice, and their free plan includes a free trial as well. You can try both programs out for free to see which one you like. However, if you like one and want to use it on more than one computer, that's where the price will come in. 82157476af
